АННОТАЦИЯ:

A historical analysis of the human resource potential formation in the field of preventive medicine for the health care system at various stages of the 20th and 21st century development of the Kyrgyz statehood was carried out. The purpose of the study was the examination of the formation of a cadre of healthcare system specialists in the field of preventive medicine in the recent history of the Kyrgyz state. A retrospective analysis of the resource potential of science and education in ensuring the sanitary and epidemiological well-being of the country was carried out on the basis of a historical-genetic, comparative and descriptive approach. Spatial realization of educational standards in the specialty "hygiene and sanitation" in the Soviet period 1959-1989 and in the sovereignization period 1990-2022 - preventive medicine specialty envisaged the continuity of the integrative educational process at under- and postgraduate stages. In modern conditions, the need for detailed analysis of educational programs to bring them up to the current new public health requirements declared by WHO has matured. Today, the material and technical basis of the departments of hygiene, epidemiology, microbiology and other specialized departments does not meet to any significant measure modern requirements for the conduct of the educational process. Thus, the fundamental modern tasks facing the healthcare system in the 21st century require serious attention of the State to the problems of preventive medicine specialists training to ensure the sanitary and epidemiological well-being of the country's territories and maintaining the health of the population.
